

Subject: jad session 1

To:

This is requirements of the current project.

Kindly find below the summary of meeting notes (requirements) with the client,

Task

Primary Actor	Secondary Actor	Use Cases
User	Doctors	Login System - p
Skype	Apex App	Register User-p
	URL	Go to URL-p
	Customer's representative	Provide username-p
	Plan Module	Provide password-p
	Know more Options	Request Quote-p
	Google map	Calculate Quote-s
		Get discount-p
		Provide discount-s
		Pay charges-p
		Display calculated amount-s
		Contact representative-p
		Provide different options-s
		Place call-p
		Contact through skype-p
		Leave email/number-p
		Representative call back-s
		Estimate cost-s
		Provide different services-s
		Provide locations- s
		Provide list of doctors-s
		Provide know more options- s
		Provide results-s
		Purchase plan-p
		Compare cost/benefits-p
		Offer different plans-s
		Customize Plan-p
		Increasing/decreasing coverage-p

Any user who wants to login, should first register with Apex. User will go to URL " www.....com" and there they will register themselves. System will register that particular user with unique Username/ ID and Password. User will be able to login with the same Username/ID and Password in future.

If user wants to have a quotation for any plan, they will request a quote from the system and the system response should be the calculated quote for that plan which user has selected. By that time, if company is providing any discounts and offers and user want to see how much he would be paying after the discounts and offers applied, the system should display the calculated amount for the

customer's premium. When user wants to contact a representative they should have different options like; the number appears on the screen, the email id and the web calling feature. That means user can directly place a call to that number or contact through Skype. User should also be able to email and leave his/her number, where customer care representative can call them back and have a communication.

There must be a feature which allows user to estimate the average cost of their future doctors' visit. The system should ask user about what kind of service he/she wants to get and in which area (geographical). On that basis, the list of doctors should be displayed on the screen. If any user wants to know more regarding benefits, coverage, services, or anything about Apex insurance, the feature 'find out more' should enable users to discover more. User should be able to get the proper results whatever they want for.

Before purchasing any plan customers want to compare the costs and benefits offered by that plan. Therefore the 'compare plan modules' functionality provide a platform where user can see different plans and the cost/ benefits associated with them. User can also create their own customized plan by increasing or decreasing coverage on different services. Like; on health benefits or drug benefits etc.
